

Idle Control Bus Function

An Idle Timer Starts when the following equation is true:

(Neutral Hi **OR** Neutral Lo) **AND NOT**(Lift Deployed)

The Idle Timer is Preset with 4 DIP Switches.

An Alarm/Horn is turned on when the Idle Timer expires.

This system is reset when the ignition key is turned off.

NOTE: It is assumed that Lift Deployed is Ground.

The picture below illustrates the user interface of an optional Laptop Programmable Idle Controller. This unit does not incorporate any DIP Switches, and provides more functional options.
